B. Phone numbers

time limit per test: 2 seconds
memory limit per test: 256 megabytes

Phone number in Berland is a sequence of n digits. Often, to make it easier to memorize the number, it is divided into groups of two or three digits. For example, the phone number `1198733` is easier to remember as `11-987-33`. Your task is to find for a given phone number any of its divisions into groups of two or three digits.

Input

The first line contains integer n $(2 \le n \le 100)$ — amount of digits in the phone number. The second line contains n digits — the phone number to divide into groups.

Output

Output any of divisions of the given phone number into groups of two or three digits. Separate groups by single character `-`. If the answer is not unique, output any.

Examples

input Copy

```
6
549871
```

output Copy

```
54-98-71
```

input Copy

```
7
1198733
```

output Copy

```
11-987-33
```

→ Attention

The package for this problem was not updated by the problem writer or Codeforces administration after we've upgraded the judging servers. To adjust the time limit constraint, a solution execution time will be multiplied by 2. For example, if your solution works for 400 ms on judging servers, then the value 800 ms will be displayed and used to determine the verdict.
